Does circle have infinite sides?

It might be more defensible to say that a circle has infinitely many corners than infinitely many sides (although this is not a question that seems to get asked very often). To start with, if a corner of a square is a point at which its boundary line is not straight, then every point on the circle satisfies that.

How many sides are there to a circle?

There are three equivalent classes here. square has four sides and four corners, while a circle has only one side and no corners.

How many corners does circle have?
