How do you draw an involute gear tooth profile?

When drawing an involute, you draw one side of one tooth, mirror that to make a whole tooth, and that copy that around your gear the right number of times. A new involute has to be drawn for each size of gear in your system. To begin drawing, lay out three concentric circles: One at the pitch circle.

How do you calculate gear size?

Root Diameter (df) is the diameter of the root circle; its value is: df = m (z â€“ 2.5) or df = de â€“ 2h. Center Distance (dc) is the distance between the shafts of the gear and the pinion; its value is: dc = (D + d) / 2, where â€œDâ€• corresponds to the pitch diameter of the gear and â€œdâ€• to the pitch diameter of the pinion.

What is a gear in engineering?

A gear is a type of machine element in which evenly spaced teeth are cut around cylindrical or conical surfaces. By interlocking a pair of these elements, they are used to transfer rotation and forces from the driveshaft to the driven shaft. Gears can be classified by shape as involute, cycloid, and trochoidal gears.

What are gear ratios?

A gear ratio is the ratio of the number of rotations of a driver gear to the number of rotations of a driven gear. A colon is often used to show a gear ratio: gear ratio = rotations of a driver gear : rotations of a driven gear. For every rotation of the 45-tooth gear, the 15-tooth gear must rotate 3 times.
