

# How to Turn Off AutoCAD Locked Position Attribute

## Description

AutoCAD is a widely used CAD software that offers a multitude of features to enhance design precision and efficiency. However, one attribute that can sometimes pose challenges is the locked position attribute. When enabled, this attribute restricts the movement and modification of objects or blocks in your drawings. For designers and engineers who need flexibility and freedom to make adjustments, understanding how to turn off the AutoCAD locked position attribute is crucial. In this article, we will explore various methods to disable this attribute and regain control over your designs.

## Key Takeaways

- The locked position attribute in AutoCAD restricts the movement and modification of objects or blocks in drawings.
- Turning off the locked position attribute can be done by unlocking objects individually, using the “Unlock All” command, modifying block definitions, or disabling the attribute globally.
- The Properties palette, Block Editor, and Customize dialog box are essential tools for managing the locked position attribute in AutoCAD.
- Temporary lock and custom shortcuts can provide additional flexibility and convenience when working with the locked position attribute.

## Understanding the Locked Position Attribute

Before diving into the solutions, let's first understand what the locked position attribute is in AutoCAD. When this attribute is enabled for an object or a block, it restricts its movement or modification. This can be useful in certain scenarios to prevent accidental changes, but it can become problematic when you need to edit or reposition elements.

## Method 1: Unlocking Objects Individually

The simplest way to turn off the locked position attribute in AutoCAD is by unlocking objects individually. Follow these steps:

1. Select the object or block that you want to modify.
2. Right-click on the selected object to open the context menu.
3. Choose the "Properties" option from the menu.
4. In the Properties palette, locate the "General" section.
5. Look for the "Locked" property and change its value from "Yes" to "No."
6. Close the Properties palette.

By unlocking objects individually, you can freely move and modify them as needed. However, this method can be time-consuming if you have numerous objects with the locked position attribute.

## Method 2: Using the Unlock All Command

If you have multiple objects with the locked position attribute and want to unlock them all at once, AutoCAD provides the "Unlock All" command. Here's how you can use it:

1. Type "UNLOCKALL" in the command line and press Enter.
2. AutoCAD will prompt you to confirm the unlocking of all objects. Type "Y" for Yes and press Enter.

This command releases the locked position attribute for all objects in your drawing, allowing you to freely edit and reposition them.

## Method 3: Modifying the Block Definition

In some cases, the locked position attribute may be applied to an entire block rather than individual objects. To turn off the locked position attribute for a block, follow these steps:

1. Select the block that has the locked position attribute.
2. Right-click on the block and choose the "Block Editor" option from the context menu.
3. In the Block Editor, select the objects within the block.
4. Right-click and choose "Unlock" from the context menu.
5. Exit the Block Editor and save the changes.

By modifying the block definition and unlocking the objects within it, you can regain control over the locked position attribute for the entire block.

## Method 4: Disabling the Attribute Globally

If you find the locked position attribute to be more of a hindrance than a helpful feature, you can disable it globally in AutoCAD. Here's how:

1. Click on the "Application" button at the top left corner of the AutoCAD window.
2. Go to the "Options" menu.
3. In the Options dialog box, navigate to the "Open and Save" tab.
4. Look for the "Object Selection" section.
5. Uncheck the "Lock position" option.
6. Click "Apply" to save the changes.

By disabling the locked position attribute globally, AutoCAD will no longer enforce it on any objects or blocks. This gives you complete freedom to modify and reposition elements as needed.

## **FAQ: How to Turn Off AutoCAD Locked Position Attribute**

### **1. How can I determine if an object has the locked position attribute in AutoCAD?**

To determine if an object has the locked position attribute in AutoCAD, you can use the Properties palette. Select the object and right-click to access the context menu. Choose the "Properties" option, and in the Properties palette, look for the "Locked" property under the General section. If the value is set to "Yes," it means the object has the locked position attribute enabled. If the value is "No," then the object is not locked and can be freely modified.

### **2. Can I unlock multiple objects simultaneously in AutoCAD?**

Yes, you can unlock multiple objects simultaneously in AutoCAD using the Unlock All command. Type "UNLOCKALL" in the command line and press Enter. AutoCAD will prompt you to confirm unlocking all objects. Press "Y" for Yes, and all the locked position [attributes](#) will be released for the objects in your drawing. This method is useful when you have numerous objects with the locked position attribute and want to unlock them all at once, saving you time and effort.

### **3. Is it possible to lock and unlock objects within a block individually?**

Yes, it is possible to lock and unlock objects within a block individually in AutoCAD. If you want to modify specific objects within a block while keeping others locked, you can access the Block Editor. Right-click on the block and choose the "Block Editor" option from the context menu. Within the Block Editor, select the objects you want to unlock, right-click, and choose "Unlock." Once you exit the Block Editor and save the changes, only the selected objects will be unlocked, while the rest of the block remains locked.

### **4. Can I disable the locked position attribute for all objects in AutoCAD?**

Yes, you can disable the locked position attribute globally in AutoCAD. By doing so, the locked position attribute will no longer be enforced on any objects or blocks. To disable it, click on the "Application"

button at the top left corner of the AutoCAD window, go to the “Options” menu, and navigate to the “Open and Save” tab. In the “Object Selection” section, uncheck the “Lock position” option. Click “Apply” to save the changes. Once disabled, you will have complete freedom to modify and reposition objects without any restrictions.

## **5. Will turning off the locked position attribute affect other object properties in AutoCAD?**

No, turning off the locked position attribute will not affect other object properties in AutoCAD. The locked position attribute is independent of other object properties such as color, layer, linetype, etc. Disabling the locked position attribute only allows you to freely modify the position and movement of objects without impacting any other properties. So, you can make changes to the objects while preserving their other characteristics and attributes.

## **6. Can I lock the position of objects temporarily in AutoCAD?**
